

Gary Hyde - Staff Product Engineer Application

Winter Garden / Orlando, FL | gary.robert.hyde@gmail.com | (407) 473-7206 jobs.garyhyde.com

Dear Ashby hiring team,

I am applying for the Staff Product Engineer role, and the reason starts with what I have been building. I made Pathara, an AI product that runs the job search for candidates: an AI agent pipeline that turns a resume into ranked job matches with tailored materials. That is the same space Ashby lives in, all-in-one recruiting software with AI woven through every layer, just approached from the candidate side instead of the recruiter side. I understand where your product is headed because I have been building in it, and that is exactly why this role excites me.

That habit of owning a product end to end shows up across everything I have shipped. For TeeTimes, I designed the multi-tenant PostgreSQL data model, the Node.js booking engine, the background job pipeline on BullMQ and Redis, and the React frontend on top, all in one TypeScript stack. Pathara I built the whole way through, from the intake flow to the agent pipeline to the per-candidate results portal. In each case there was no separate design or backend resource, so getting the schema right was my problem, and so was the UI that proved it. That is the way you describe the work, one TypeScript codebase with engineers owning projects from schema to UI, and it is already how I work.

The async-first, almost-no-meeting culture is a real draw. I have worked independently and remotely for over ten years, and my default is to write the decision down. Specs, plans, and review notes are how I communicate, written to the standard a distributed team needs to act without a call. When a stock-overselling bug spanned both our WooCommerce and Odoo systems, I traced it to root cause and wrote it up as a document the team could use, not a verbal recap.

I read staff level here as technical leadership expressed through building, and that is the part I am most excited about. I lead by setting conventions and building the tooling that holds them, like the automated code review tooling I built that produces structured scorecards with Ship, Fix, and No-Ship verdicts. I have built AI into my daily workflow since the moment the tools became usable, treating them as genuine force multipliers rather than autocomplete, which lets me design, build, and review far more in a day without dropping the quality bar.

Happy to talk - [Book a call](#)
