Hiring Team,

Most engineers who say they use AI tooling mean they have a chat window open. The Internal Enablement role is about the other thing: building the tooling that makes everyone else faster. That is the work I already reach for, so this is a straightforward fit to write about.

The clearest example is a multi-model AI code-review system I built and run as team tooling. It sends a change out to several models, collects their feedback, and synthesizes the results into a single Ship, Fix, or No-Ship scorecard with a human approval gate before anything lands. I also designed a custom Git commit convention, Mission Codes, that improved traceability across a multi-developer Odoo.sh workflow. Neither was assigned. They came from the same instinct your team is built around: find the friction the whole team hits and remove it once, for everyone.

On the agent side I am hands on in production, not just in demos. Pathara is a job-search product I built around a Claude API managed-agent pipeline that handles research and document generation end to end, with per-run cost and token telemetry and per-candidate data isolation. I live in Claude Code and Cursor daily, and I treat the harness around the model, the tools and the verification steps, as where the quality actually comes from. That is the same mindset MCP and OpenTelemetry exist to serve, and it is how I think by default.

A note on stack, senior to senior: TypeScript and Node are my core, used across every recent project. Python is a working second language for me, real integration code rather than my primary, and I would rather say that plainly than dress it up. On AWS, I run the equivalent patterns in production today (serverless functions, managed Postgres, object storage, queues, webhook architecture) and I ramp fast on a new provider's primitives. What I am most confident about is the judgment for what makes a tool worth other engineers trusting, and that is the part of this role I want to own.

Happy to talk.
