

Gary Hyde

Senior AI Engineer Application

Winter Garden / Orlando, FL | gary.robert.hyde@gmail.com | (407) 473-7206 | jobs.garyhyde.com/grafana-labs/senior-ai-engineer

Hiring Team,

I am applying for the Senior AI Engineer role building internal multi-agent automation. I read the description twice because it matched my current work so closely. I have shipped an AI agent pipeline to production, I built the multi-model code review tooling my team relies on, and I work inside Claude Code and Cursor every day. This is not a direction I am hoping to grow into. It is the center of what I do right now.

The clearest proof is Pathara, a job-search product I built end to end. A candidate submits a resume and a short questionnaire, and a Claude API agent pipeline does the research and writing, returning ranked job matches, each with a tailored resume, cover letter, and interview prep doc, plus an application tracker. I built the intake flow, the agent pipeline that runs from intake all the way to finished documents, and the per-candidate portal, with per-run cost and token telemetry so the automation is observable instead of a black box. Lumi is a second shipped AI product, with an LLM reading pipeline and streaming, deployed on Vercel. And the code review tooling I built runs a diff through several models, has each reason over the change, and merges their findings into one Ship, Fix, or No-Ship scorecard with a human approval gate before anything happens. That last one is multi-agent orchestration in miniature, with the verification step built in.

On the daily AI tooling the role asks for, I am already there. Claude Code and Cursor are how I build, not a novelty I tried once. I introduced AI-augmented workflows on my current team that compressed feature delivery while keeping documentation and review standards intact, and I spend real time on the harness around the model, the tools and verification and context discipline, because that is where most of the quality actually comes from.

I want to be straight about the stack, senior to senior, because I would rather you trust the rest of this letter. Node and TypeScript are my core, the language I reach for first and the one all of the above is built in. Python is a working second language for me. I read it, write it, and have shipped it inside the WooCommerce and Odoo integration and module work, but I will not claim the depth there that I have in TypeScript. Same with the agent frameworks: I have built directly against the Claude API and the MCP model rather than through LangChain or CrewAI, so I

would be picking up your exact toolchain, not the underlying ideas. I learn fast, I take feedback well, and I would rather earn ownership by shipping than overstate experience I have not built yet.

Fully remote with no on-call fits how I have worked for over a decade. I would welcome the chance to talk.
