

Gary Hyde

Full-Stack Software Engineer Application Winter Garden / Orlando, FL I

gary.robert.hyde@gmail.com | (407) 473-7206 | jobs.garyhyde.com/prairielearn/full-stack-software-engineer

Dear PrairieLearn hiring team,

I am applying for the Full-Stack Software Engineer role, and I will be direct about why: your stack is the stack I already build on every day. Node.js and TypeScript on the server, PostgreSQL underneath, React on the frontend, AWS for infrastructure, and now LLM and agent tooling woven through it. I have spent years on exactly this foundation, and the last stretch of it has been spent adding AI to the same stack rather than treating it as a separate thing.

That end-to-end ownership runs through everything I have built. For TeeTimes, I designed the multi-tenant PostgreSQL data model, the Node.js and Express backend, the background job pipeline, and the React frontend on top, all in one TypeScript codebase. Kora took the same vertical approach for a direct booking engine, a Node.js payments and scheduling engine on PostgreSQL with Stripe and Stripe Tax scoped from day one. In both cases there was no separate design or backend resource, because there was no second engineer to hand the work to. The schema being right before anything above it could be was my problem, and so was the React UI that proved it.

The LLM and agent side of the role is where I think I stand out. I built Pathara, an AI product, end to end on the Claude API: candidates submit a resume and a short questionnaire, and an agent pipeline returns ranked job matches, each with a tailored resume, cover letter, and interview prep doc, plus an application tracker. I built the intake flow, the agent pipeline that does the research and writing, and the per-candidate portal on a Supabase Postgres backend with row-level security and storage. Beyond the product, I build LLM tooling into how a team works. On my current team I built automated code-review tooling that synthesizes multiple AI models into structured Ship, Fix, and No-Ship scorecards, and I work in Claude Code and Cursor every day. I treat these as genuine force multipliers, not autocomplete.

The shape of the team is a real draw, not something I would tolerate. Small, bootstrapped, profitable, flexible hours, a lot of autonomy is the environment where I do my best work. I have worked independently and remotely for over ten years, scoping and shipping products solo, and I move fastest exactly when the process is light and the trust is high. Education technology is also work I want to do, where the product actually helps the people using it learn.

I would welcome the chance to show how I work in your codebase. Thank you for reading.

Gary Hyde

Sincerely, Gary Hyde
